The 10 Best Free and Open-Source UI Component Libraries Right Now

These UI Component Libraries Make Your Website Look Way More Expensive

These are the hottest new free open-source UI component libraries that let you create the most trendy web animations and UI interactions at record speed. And the best part? They're as easy as copy and paste.

[Link for free \(non-member\) readers](#)

If you've been spending hours tweaking Tailwind utility classes, wiring animations by hand, or jumping between Figma and code trying to keep things consistent, this new generation of UI components is honestly insane. These aren't just UI kits. They're design engineered components built for real-world development.

Before jumping in, let's clear one thing up.

What Is a UI Component Library?

A lot of people start with a UI kit in Figma. That gives you static design components, which is great, but then you still have to code everything yourself. You need to figure out animations, install dependencies, configure libraries, and somehow make all of it work together.

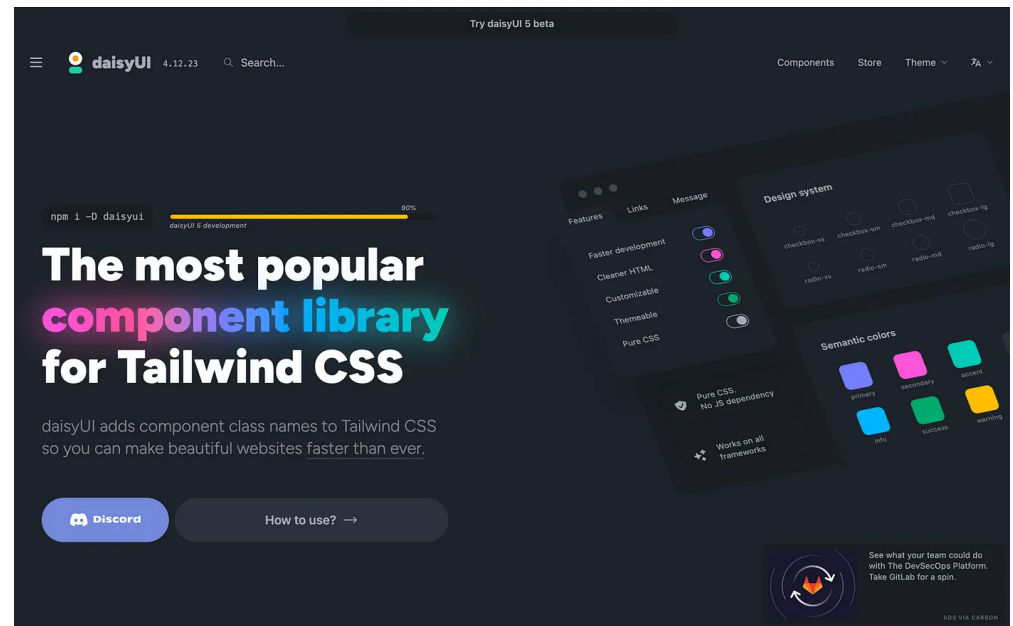

That's where modern UI component libraries completely change the game.

These libraries are built for React and Tailwind. They give you production-ready components with animations, accessibility, responsiveness, and customization already

baked in. You don't just design faster. You build faster.

Let's jump into the best ones right now.

01: DaisyUI

<https://daisyui.com/>

DaisyUI is hands down one of the most amazing open-source UI component libraries out there, especially if you're a beginner.

What makes DaisyUI unique is that it turns Tailwind CSS into a fully functional design system. You get pre-styled components, built-in themes, and a clean, consistent design language right out of the box.

And this isn't just dark mode. DaisyUI lets you create actual themes, meaning your UI can match your brand, your

mood, or even different product styles without rewriting everything.

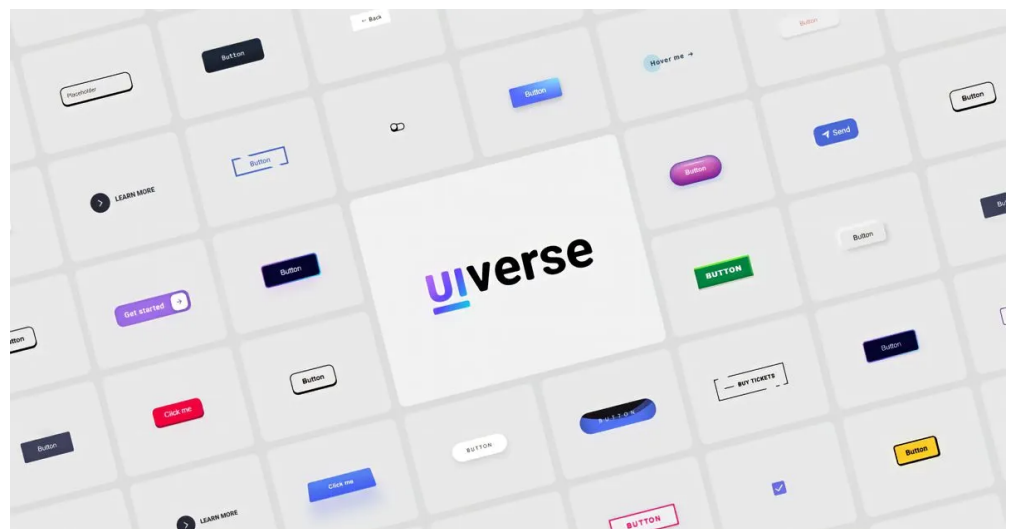

The real magic of DaisyUI is its simplicity.

It's pure CSS. It's framework-agnostic. You can grab any component, drop it into your project, and tweak it as much or as little as you want. It's perfect for anyone who loves the flexibility of Tailwind but doesn't want to spend hours writing utility classes from scratch.

What's even cooler is that DaisyUI has officially released a Figma library. That means designers and developers can now use the same design system in both Figma and code, which makes collaboration way smoother.

02: Uiverse

Think of Uiverse as Pinterest for UI components.

<https://uiverse.io/>

Need a glowing button? A floating card? A slick progress bar? It's all here, beautifully curated and ready to use.

Every component comes with copy-paste ready code, so you can go from inspiration to implementation in seconds. It's perfect for designers exploring creative ideas and developers who just need quick polish solutions.

And yes, you can copy these components directly into Figma as well.

Uiverse is all about creativity on demand. It's full of cool components you didn't even realize you needed until you saw them.

03: Float UI

Float UI gives you everything you need to make incredible websites without overthinking layout or structure.

<https://floatui.com/>

It's packed with components like hero sections, pricing tables, buttons, and more. Everything is pre-designed to save you hours of fiddling with layouts.

It works out of the box with React, Vue, Svelte, and even plain HTML. And since it's built with Tailwind, everything is fully customizable using utility classes.

Whether you're building a dashboard, a landing page, or just need a button that actually looks good, Float UI is no mess, no fuss. Just copy, paste, and move on.

04: shadcn/ui

This next one is the GOAT of copy-paste UI component libraries.

<https://ui.shadcn.com/>

Launched in 2023, shadcn/ui absolutely blew up, and it's no

secret why developers and designers love it.

Built with Radix UI and Tailwind CSS, it's packed with components that are simple, accessible, and fully customizable. Unlike other libraries, shadcn doesn't lock you into predefined styles.

Instead, it works as a foundation that lets you build your own custom UI library.

Buttons, modals, forms, you pick only what you need. It's perfect for quick projects, but it also scales effortlessly for larger builds.

The best part is that everything is styled your way. No wrestling with weird defaults. No fighting the framework.

Shadcn is already solid, but if you want more animation and visual flair, things are about to get even better.

05: Aceternity UI

Aceternity UI screams, "I spent way more time on this than I actually did."

<https://ui.aceternity.com/>

Inspired by shadcn/ui, this library brings Framer Motion into the mix, and the animated components are just beautiful. Hover effects, transitions, and interactions look insanely polished.

This is another free open-source UI component library that's entirely copy and paste, making implementation easy while still allowing deep customization.

You can build dropdowns that filter products like a pro, navigation bars, and sleek cards for showcasing products or testimonials.

It's minimalist but powerful, kind of like that one guy at the gym who quietly lifts absurd amounts of weight.

06: Magic UI

Speaking of lifting, let's take it up a notch.

<https://magicui.design/>

Imagine your website is a decent bowl of noodles. It does the job, but it's kind of boring. Magic UI is the chili oil that kicks it up a level.

Built on top of shadcn/ui, Magic UI is a free open-source library serving up over 50 animated components built with React, TypeScript, Tailwind CSS, and Framer Motion.

This library is perfect for engaging landing pages, SaaS apps, startup websites, and product marketing sites like Linear, the one we all can't stop drooling over.

You get wild interactive elements like 3D cloud animations, animated circular progress bars, and even scratch-to-reveal cards.

Installation is simple. Just run a terminal command, import the components into your React project, and tweak them using Tailwind. Everything you're seeing can be built using

Magic UI.

07: HeroUI (Formally NextUI)

<https://www.heroui.com/>

If you're working on a larger project and need something more robust and responsive, HeroUI is where things get serious.

HeroUI is more like a full design system than just a UI component library. It's sleek, intuitive, and ridiculously practical, especially if you're working with Next.js.

It comes with over 210 plug-and-play components optimized for performance with minimal CSS and JavaScript overhead. HeroUI fully supports server-side rendering and is designed with responsiveness and accessibility in mind.

Dark mode is baked right in, because let's be honest, who doesn't love dark mode?

On top of that, you can theme HeroUI however you want, making it visually flexible for almost any type of project. There's also a solid Figma UI kit, so designers can jump straight into primitives, build screens, and customize flows before handing things off to developers.

08: Chakra UI

Chakra UI is one of those libraries that just makes sense the moment you use it.

<https://chakra-ui.com/>

This is a fully accessible, production-ready UI component library built for React, and it's loved for how clean and intuitive it feels. Everything is built with accessibility in mind by default, so you're not scrambling later to fix keyboard navigation or ARIA issues.

The styling system is props-based, which means instead of writing a bunch of custom CSS or Tailwind classes, you can control spacing, colors, layout, and responsiveness directly in your components.

It's perfect for dashboards, SaaS products, and internal tools where clarity and usability matter more than flashy animations. Chakra UI won't scream for attention, but it will quietly make your app feel professional, consistent, and solid.

Sometimes boring is actually a compliment.

09: Mantine

Mantine feels like the library you reach for when you want power without chaos.

<https://ui.mantine.dev/>

It's a massive React component library packed with everything from forms and modals to date pickers, hooks, and advanced UI patterns. This isn't just about looks. Mantine gives you logic, utilities, and UI all working together.

What really stands out is how flexible it is. You get full theming control, dark mode out of the box, and components that feel modern without being over-designed.

Mantine is especially great for complex apps where you need more than just buttons and cards. Think admin panels, analytics dashboards, or products with a lot of user interaction.

It's one of those libraries where the deeper you go, the more you appreciate how well thought out it is.

10: Headless UI

<https://headlessui.com/>

Headless UI is for people who want total control.

This one is built by the Tailwind Labs team, and instead of giving you pre-styled components, it gives you fully accessible, completely unstyled UI primitives.

Menus, dialogs, dropdowns, transitions, all the hard logic is done for you. You bring your own styles.

If you love Tailwind and want to design everything yourself without reinventing accessibility and interaction logic, Headless UI is an absolute dream. It plays perfectly with Tailwind, React, and Vue.

This is the library you use when you want your UI to feel 100 percent custom, but you still want rock-solid behavior under the hood.

It's not flashy. It's not opinionated. And that's exactly the point.

Final Thoughts

This new wave of open-source UI component libraries is completely changing how fast and how well we build interfaces. Instead of starting from scratch every time, you can now focus on experience, interaction, and polish without sacrificing speed.

And if you want to learn how to use tools like these to build

real, usable products backed by solid research and business strategy, there are plenty of resources out there to help you level up.

If design systems interest you, that's a whole world worth diving into next.

Did you learn something good today?

Then show some love. 🙌
