

1. Download Ollama from [Ollama](#)
2. Install
3. Verify version — ollama — version

```
C:\Users\admin>ollama --version  
ollama version is 0.15.2  
  
C:\Users\admin>_
```

4. Verify Ollama is running from browser

ollama

5. Verify Ollama UI application

We can use Ollama UI application for Local chat

Ollama

6. Download models

There are multiple models those we can use with ollama , we can download those and can start using.

For our local development we will use Phi3

We can use below command to download model

```
ollama pull phi3
```

7. List down available Models

Command

```
ollama list
```

8. Running model

Command

```
ollama run phi3
```

9. Text generation or content generation

Start asking quesiton you will be gettng answer.

ollama

Important key point

During text generation there is heavy processing done by ollama model to generate required text so CPU usage will be go higher as below, this is key important thing which we need to take care while asking any thing to models. and due to this high CPU usage, none of any model is free, we have to pay for it

10. Text generation via API

Ollama also offer to intract with model via api so we can generate text from

api also, here it is very basic command to get data

```
curl http://localhost:11434/api/generate -d '{"model": "phi3", "prompt":
```

| *Question- Explain Dependency Injection*

Interaction with C#

As we can connect ollama with API , we can create httpclient in c# and can start communicate.

```
[HttpPost("AskQuestionsToOllama")]
public async Task<IActionResult> GenerateTextUsingOllama(string prompt)
{
    var client = new HttpClient();
    client.BaseAddress = new Uri("http://localhost:11434");

    var payload = new
    {
        model = "phi3:mini",
        messages = new[]
        {
            new { role = "user", content = prompt }
        },
        stream = false,
        options = new
        {
            num_predict = 150,
            temperature = 0.5,
            top_p = 0.9,
            num_ctx = 2048
        }
    };

    var json = JsonSerializer.Serialize(payload);
    var content = new StringContent(json, Encoding.UTF8, "application/json");

    var response = await client.PostAsync("/api/chat", content);
    var result = await response.Content.ReadAsStringAsync();
    return Ok(result);
}
```

Result

Conclusion

We can see how we can use ollama for local AI development.

#dotnet

#AI

#ollama

- Ollama
- Artificial Intelligence
- Dotnet
- Technology
- Programming
