Obsidian + Claude Code is your 24x7 AI Agent: Here is how to build yours

Obsidian + Claude

I used to treat Obsidian like a pretty diary.

It was a girly thing for me. Nice themes. Cute graph view.

Daily notes.

But if I am honest, most of my best ideas went in... and never came back out.

They just sat there. I have already discussed about my messy workstation multiple times before. If you know already, you know me :D

I would write fire insights after a client call, or a brilliant hook at 1 a.m., and then three weeks later I was manually searching random notes like, “Where did I write that thing about Grok?” and “What was that course idea again?”

And mind you I have a writing habit and this is the picture of my current notebook. I write both notes on app and notebook.

My current notebook

It was chaos.

Then I saw a demo where someone had Claude Code actually reading and writing directly into their Obsidian vault. It was pulling old notes, tracing ideas across months, and even creating new notes in the right folders

for them. It did not feel like “AI plus notes.”

It felt like a tiny brain had moved into their vault and started working full time.

That broke something in my head.

Because:

- **Obsidian is just markdown files in a folder.**
- **Claude Code can read and write local files through tools.**
- **There is even a dedicated Obsidian MCP bridge built for this.**

Which means, with a bit of setup, you can literally say: “Claude, scan my last 30 daily notes, pull out all open tasks, and create a new note called ‘This week focus’.”

And it will do it. Inside your vault. In your structure.

Hey guys, this is Kanika, your Passive Income Coach, and today I want to show you the simple Obsidian + Claude Code setup that made my vault feel alive, plus the exact way I use it daily so it works like a 24x7 AI agent instead of a dead note archive.

So without wasting any time, let's get started.

The reframe

Most people have this pattern:

They write religiously.

They capture everything.

Then they still feel disorganised.

Why?

Because their second brain is not actually doing any thinking.

It is just a storage unit.

Obsidian is amazing for local notes, backlinks, and structure. But on its own, it does not wake up in the morning and say, “Hey, you have three half-finished projects and two ideas you forgot about. Want to work on them?”

It just waits for you.

On the other side, you have AI tools like Claude. Super smart. Great at pattern matching. But they know nothing about your actual life. Every time you open a chat, you start from zero.

“Hey, I am working on this. Hey, here is my context. Hey, here is what I want.”

Here is what most people miss:

Your vault is already the dataset.

Claude Code is already the brain.

You do not need more tools. You just need to connect these two in a clean way and give them rules.

When Obsidian becomes the place where all your serious notes live, and Claude Code can:

- Read those notes.
- Follow your links.
- Respect your folders.
- Write new notes for you.

Then your setup stops being “a note app plus a chatbot” and starts behaving like a tiny agent that knows your projects, your style, and your history.

That is the shift.

The economics/framework

Let’s talk about what this actually changes in your day.

Most of us waste time on three stupid things(Atleast I do):

- **Remembering what we were doing last week.**
- **Hunting for “that one note” we wrote somewhere.**
- **Turning messy notes into clean plans or content.**

This Obsidian + Claude Code combo attacks all three.

What Obsidian brings to the party:

- **Local-first vault:** everything is just markdown files inside a folder called a vault.
- **Flexible structure:** you can organise by projects, dates, people, or topics.
- **Backlinks and tags:** your notes are connected, not isolated.

What Claude Code brings:

- **Code execution + tool calling:** it can run tools that read and write files.
- **Filesystem / Obsidian MCP:** bridges that expose your vault to the agent in a safe, structured way.
- **Context:** it can see your notes, not just what you paste into chat.

Now imagine the ripple effect if:

- Every daily note you write is something Claude can scan later.
- Every project note lives in a predictable folder.
- Your agent has a one-page brief (`CLAUDE.md`) explaining who you are, how your vault is structured, and what it should help with.

Suddenly:

- Weekly reviews are not manual. You ask, “Read my last 14 daily notes and tell me what I keep delaying.”
- Search all notes mentioning ‘Grok’ and ‘research’ and outline an article from them.”
- You ask, “Find all notes tagged `client-x` and list open tasks.”

You are not using AI.

You are letting an agent sit inside the same knowledge system you use, and that is why it feels 24x7.

Now I will show you exactly how I wired this up and how I actually use it.

The detailed blueprints

How I actually set it up (Now this is my style but yours could be different)

I am going to keep this as simple as possible. No scary

developer kind of talk. Just the steps I followed.

Step 1: One serious vault

I picked one Obsidian vault that would become my “real” brain:

- All work notes
- All content ideas
- All offers and funnels
- All meeting notes

No duplicate note systems. No parallel apps for “just this one thing.”

If it matters, it enters the vault.

My folder structure is simple:

- 01 Daily
- 02 Projects
- 03 Content
- 04 People
- 05 Archive

That is it.

Step 2: Install Claude Code

Then I installed Claude Code on desktop.

The important bits:

- It runs as a local app and can talk to tools like filesystem or Obsidian MCP.
- It has a sidebar where you can see tools and file access.
- You are still chatting with Claude, but now it can “reach into” your files when allowed.

Step 3: Give Claude access to the vault

There are two basic ways to do this.

The simple way:

- Use the filesystem MCP server, point it at your Obsidian vault path, and enable it in Claude Code.
- Now Claude can:
- List files.
- Read notes.
- Create or edit markdown in that folder.

The nicer way:

- Install the Obsidian-specific Claude Code MCP plugin inside Obsidian.
- Start the plugin so it exposes your vault to Claude with knowledge of tags, links, and active note context.
- Connect to that from Claude Code, so it sees not just “files” but “your current Obsidian session.”

I started with filesystem first, then upgraded to the Obsidian MCP once I was comfortable.

Step 4: Create a `CLAUDE.md` instructions file

This was the big unlock for me.

At the root of my vault, I created a file called `CLAUDE.md`.

Inside it, I wrote things like:

- Who I am.
- What my vault structure means.
- What kind of help I expect.
- What it should never do.

For example:

- I am Kanika, a passive income coach and content creator.
- Daily notes live in `01 Daily`. Active projects live in `02 Projects`.
- When in doubt, summarise rather than overwrite. Never delete notes without asking.
- My writing style is casual, short paragraphs, no big words, talk like a friend.

Every time Claude Code connects, it can read this and come in already trained on my world.

Step 5: Start with two simple use cases

I did not try to automate my whole life.

I picked just two things:

1. Weekly review.
2. Content idea mining.

For weekly review, I asked:

“Read my last 14 notes in `01 Daily`.

List:

- all open TODOs,
- topics I mentioned more than once,
- and 3 projects I clearly care about but have not moved.

Save this as a new note called `Weekly review - [date]` in `02 Projects`.”

For content ideas, I asked:

Search `03 Content` and `01 Daily` for notes that mention ‘Grok’, ‘Perplexity’, or ‘Claude Code’.

Create a new note in `03 Content` called `AI research engine ideas` and list:

- potential article titles,
- hooks,
- and 5 bullet point outlines based on what you find.

Seeing those notes appear in the vault, in the right folders, based on my own thinking, felt wild.

Step 6: Add “workflows,” not random prompts

As I got comfortable, I started turning repeating behaviours into tiny workflows.

For example:

- Every morning, from today's daily note plus active projects, create a `Today focus` section with 3 must-do tasks.
- Once a week, scan `03 Content` and suggest 3 ideas ready to record as Reels based on detail level.

I keep these favourite prompts in one note called `Workflows`, and I literally copy-paste them into Claude Code. No mental load.

Over time, this became my rule:

If I do the same thinking process twice in a row, I try to turn it into a workflow Claude can run on my vault.

Bring it together

Turning my Obsidian vault into a 24×7 AI agent was not about some crazy automation stack. It was three simple decisions:

- Commit to one serious vault.
- Let Claude Code see that vault safely.
- Teach it, in one markdown file, how I work and what I want help with.

After that, it was just small habits:

- Asking it to review daily notes instead of scrolling mindlessly.
- Letting it draft outlines from my existing ideas instead of staring at a blank page.
- Letting it remind me of projects I already said I care about.

You do not need a perfect system. You just need a living vault and an agent that finally knows you well enough to help.

So this is the easiest way your can do it.
