If You're Not Using These 20 Repos, Delete CLAUDE CODE

Most people I know use Claude Code like a slightly smarter autocomplete. They open the terminal, type a vague prompt, accept whatever it spits out, repeat.

Then they wonder why the developer two desks over is

shipping features five times faster with the exact same tool.

I wondered the same thing for a while. Last spring I caught myself rewriting the same prompt for the third time in a week, losing context every session, and quietly resenting the people who seemed to make Claude do anything. So I went hunting for what they were doing differently.

It wasn't a secret model. It wasn't a leaked feature. It was repos. Hundreds of them. Skills, plugins, hooks, subagents, memory systems, MCP servers, a whole layer of community infrastructure that quietly turns Claude Code from "fine" into "ridiculous."

Here are the 20 I actually use. If you're not running at least half of these, you're paying for a Ferrari and driving it in second gear.

Start with the official stuff

Before you go community-shopping, install what Anthropic ships.

1. **anthropics/claude-code**: the main repo. 55k+ stars. You already have it, but the README has setup tricks most people skip.

2. **anthropics/skills**: the official skills library (37.5k

stars). PDF, DOCX, XLSX, PPTX, image generation. If you ever need Claude to produce a Word doc that doesn't look like a hostage note, this is where you start.

3. anthropics/anthropic-cookbook: recipes for tool use, RAG, agent patterns, classification. I keep going back to this one.

4. anthropics/claude-code-action: a GitHub Action that lets you @claude inside a PR comment and get a code review. Took me ten minutes to set up.

The awesome lists that save you from midnight GitHub-scrolling

5. hesreallyhim/awesome-claude-code: 28.5k stars. The master index. Only Claude itself is allowed to submit PRs, which is a flex I respect.

6. ComposioHQ/awesome-claude-skills: 50+ production-tested skills. Postgres, deep research, root-cause tracing. Install via `/skill add`.

7. ComposioHQ/awesome-claude-plugins: same vibe for plugins. Frontend design, artifact builders, connect-apps.

Skills that punch way above their weight

8. obra/superpowers: 148k stars and the most popular

skills library out there. It runs Claude through brainstorm → spec → plan → TDD → review → merge with subagent orchestration baked in. After I installed it, I stopped writing my own planning prompts entirely.

9. travisvn/awesome-claude-skills: community-curated, 22k+ installs. SEO, marketing, design, security. Bonus points for actually warning you about untrusted skills.

Subagents (the real unlock)

A single Claude session gets cluttered fast. Half-read files, stale debug output, lost context. Subagents fix this by handing you a team of specialists instead of one overworked generalist.

10. wshobson/agents: 25k+ stars. Production subagents for strategy, dev, security, design, data, research. Drop-in.

11. baryhuang/claude-code-agents: 59 specialized agents. TypeScript, Python, Java, Kotlin reviewers. Great if you're onboarding a new team.

MCP servers (the bridges to your stack)

On its own, Claude Code only reads files and runs commands. MCP servers connect it to the actual tools you work in.

12. github/github-mcp-server: official, and the most-used MCP server in the ecosystem. PRs, issues, CI/CD, the whole platform.

13. microsoft/playwright-mcp: browser automation through MCP. Claude can navigate, fill forms, scrape dynamic content.

14. crystaldba/postgres-mcp: safe Postgres access. Read-only by default. Stop hand-typing SQL into your terminal.

15. upstash/context7: pulls real-time, version-specific library docs into your prompts. No more Claude inventing APIs that don't exist.

16. zilliztech/claude-context: semantic code search for huge repos. Finds the right file without you breadcrumbing it.

Orchestration and memory

Claude's biggest weakness is amnesia. Every session starts from zero. These fix that.

17. ruvnet/claude-flow: 11.4k stars. Multi-agent orchestration with persistent memory. Reshapes how teams build with AI.

18. smtg-ai/claude-squad: 5.6k stars. Terminal

multiplexer for AI coding agents. Run parallel sessions without chaos.

19. thedotmack/claude-mem: long-term memory through context compression. Solves the #1 Claude Code complaint in a single repo.

And one to keep you honest

20. nizos/tdd-guard: 1.7k stars. Automated TDD enforcement. Blocks Claude from skipping tests, then explains why it blocked it. I love and hate this one in roughly equal measure.

Bonus: AnotherWrapper

Want to build your own AI apps and tools without starting from scratch?

Now is a great time to create AI apps and print money fast.

Another Wrapper gives you 10 customizable AI demo apps to choose from. Pick one, add a feature, and you can start your startup and make money fast.

Try here: [Anotherwrapper.com](https://anotherwrapper.com)

. . .

This isn't even close to the full picture. The Claude Code ecosystem moves so fast that anything I write here will be partially outdated by the time you finish reading. If you want to keep up, ClaudeWave (claudewave/claudewave) tracks 3,800+ repos and updates every twelve hours.

But here's the thing: install five of these, and you'll already be ahead of 95% of the people paying for the same Claude subscription you do. They're using a tool. You'll be using a workshop.
