

6 ChatGPT Images 2.0 Use Cases That Will Blow Your Mind | by Nitin Sharma | May, 2026 | Medium

I'm going to break down 6 real use cases where this actually works in practice and can save you time, make you money, or give you leverage.

Image generated using [Nano Banana 2](#)

You know, over the last few days I've been testing [ChatGPT Images 2.0](#) almost obsessively, but not in the usual way people test image generators where they just try to create something cool and move on.

I wanted to see if this could handle real work, the kind of work that usually takes hours of manual effort like designing thumbnails, creating visual guides, building content assets, and all the small but time-consuming things that add up.

Because at the end of the day, that's the only question that matters: Can this actually replace effort, or is it just another tool that looks impressive for five minutes?

And honestly, this is one of the very few models, alongside Nano Banana 2, that genuinely feels useful beyond surface-level outputs.

What's different here is not just the image quality, because most tools have already reached a decent level on that front.

What actually changed is how it handles reasoning, layout, text placement, context, and

consistency all at once, which is something most image generators still struggle with.

And in this post, I'm going to break down 6 real use cases where this actually works in practice, use cases that can either save you time, help you make money, or give you leverage.

Note: This post was originally published in my newsletter, [AI Made Simple](#). It's basically where I document what actually works for me with AI, in real workflows.

With that said, let's get into it.

1. Turn any complex topic into a clean visual explainer

Most people still learn by reading 5 articles, watch 2 YouTube videos, and still feel confused.

Now compare that to this:

You paste a concept, and ChatGPT Images 2.0 generates a structured visual explanation with flow, labels, and clarity.

Here's a prompt you can try:

Explain GANs visually using an infographic. Focus on how the generator and discriminator fight each other and what happens during training.

Press enter or click to view image in full size

You see, what you get isn't just an image.

You actually get a mental model, a teaching asset, and a shareable graphic that helps you learn.

Real-world use:

- Learning dev concepts faster
- Teaching clients or teammates
- Turning boring explanations into visuals

If you're learning anything technical or complicated, this alone saves hours.

2. Create scroll-stopping LinkedIn / Twitter carousels in minutes

Designing carousels is painful, and time consuming.

You either:

- Spend 2 hours in Canva
- Or post plain text that no one reads

ChatGPT Images 2.0 removes that friction completely, and help you generate attention-grabbing carousels within seconds.

Example prompt:

Create a 6-slide attention-grabbing LinkedIn carousel on “How AI will replace repetitive jobs, and how humans will survive”. Use bold headings, minimal text, strong hierarchy, and consistent style.

Press enter or click to view image in full size

You see, it breaks content into slides, applies layout automatically, and maintains visual consistency.

Real-world use:

- Grow on LinkedIn/X without a designer
- Turn your posts into visual content
- Repurpose long-form content instantly

This can literally become your content engine.

Just so you know:

Everything I've shared here is something I actually use.

If this post changed how you think about AI even a little, that didn't happen in isolation. It came from a much bigger shift in how I use AI overall.

That's why I put that entire system down inside "[The \(Unfair\) AI Workflow Playbook](#)" with everything you need.

It's the exact set of workflows I use daily to run my work faster than feels normal, and if you apply even a few of them, you'll save hundreds of hours.

You can spend months figuring this out on your own, or you can [steal my entire playbook](#) right now.

3. Generate high-converting ad creatives without a designer

Most people don't test enough ads because design is slow but now you can generate variations instantly.

Example prompt:

Create 5 ad creatives for a productivity app. Include headline, subtext, and clean modern layout. Focus on simplicity and clarity.

Press enter or click to view image in full size

The best part is that it doesn't just design, it thinks like a marketer.

What next? You can iterate:

- Different angles
- Different headlines
- Different layouts

Real-world use:

- Test ads faster
- Validate offers quickly
- Save thousands on design

4. Create product mockups without any tools

Instead of using Photoshop, Mockup generators or hiring designers. You can now using ChatGPT Images 2.0 to generate product mockups.

Example prompt:

Create a premium product mockup of a skincare bottle placed in a minimal bathroom setting with soft lighting and natural shadows.

Press enter or click to view image in full size

Press enter or click to view image in full size

Here's another prompt you can try:

Create a clean product mockup of a mobile app dashboard on an iPhone. Use a modern, minimal background.

Press enter or click to view image in full size

[Press enter or click to view image in full size](#)

You see, it generated a couple of outputs with realistic device frames, clean lighting and with proper composition.

Real-world use:

- Landing pages
- App launches
- Portfolio projects

You can literally fake a polished product presentation in minutes.

5. Generate thumbnails that actually get clicks (not just “look good”)

Most people completely misunderstand thumbnails. They think it’s about making something that looks nice but that’s not what gets clicks.

A thumbnail has one job: To make someone stop scrolling and feel something instantly.

And most thumbnails fail because they miss the fundamentals:

- There’s no clear focal point
- The text is either unreadable or unnecessary
- The emotion is flat
- Everything blends into the background

So even if it looks “decent,” it doesn’t convert, and that’s where ChatGPT Images 2.0 becomes insanely useful.

Prompt:

Create a high-CTR YouTube thumbnail for a video titled: “AI will replace programmers”

Make sure the thumbnail includes:

- *_Strong emotional expression (fear, surprise, urgency)*
- _* • *_Large, bold, instantly readable text*
- _* • *_A single clear focal point with high contrast*
- _* • *_Clean composition optimized for small screens*

What you’ll notice is that it doesn’t just generate a random image but a thumbnail that you actually wants to use.

Press enter or click to view image in full size

Real-world advantage:

You're no longer sitting there tweaking colors, fonts, and layouts for 30 minutes trying to "make it work."

You generate multiple directions in minutes, pick what stands out, and move on.

And that's the real win.

6. Create visual SOPs that people actually follow

This one looks simple on the surface, but it's way more powerful than it sounds.

Because most SOPs don't fail due to bad information, they fail because nobody wants to read them.

I am talking about the long text instructions, messy steps, unclear flow — people skim them, misunderstand them, and then make mistakes.

So instead of writing: "How to do X", and creating an SOP that no one wants to read try ChatGPT Images 2.0.

Here's a prompt:

Create a visual step-by-step guide for: "How to post on LinkedIn daily"

Make sure it includes:

- _Clear step-by-step flow
- _• _Minimal text per step
- _• _Simple diagrams or icons
- _• Logical progression from idea → writing → posting

And here's the output:

Press enter or click to view image in full size

Real-world use:

- Onboarding new team members faster without repeating yourself 10 times
- Replacing boring SOP docs that nobody reads or follows
- Turning messy workflows into something visual, simple, and actionable

Hope you like it.

If this resonated with you, share it with someone who needs to read it, since most people want to learn practically about AI but won't access posts like this.

And that's where you can help someone you care about use AI practically and get ahead.

Also, don't forget to checkout "[The \(Unfair\) AI Workflow Playbook](#)" where I shared exact set of AI workflows I use daily to run my work faster than feels normal.
